

Prediction map of possible spatial distribution range of *Rhodiola algida* (Ledeb.) Fisch. et Mey in the Altai Mountains modelled using the Genetic Algorithm for Rule-Set Production (GARP), based on recorded species locations (yellow dots) together with climatic and topographical data for the area. A darker colour indicates a higher probability of the species being found (although note that other factors, for example biological and ecological factors, soils and land use, will also affect the actual distribution).
